Synchronization of microresonator optical frequency combs

In the context of optical physics, extensive studies of this phenomenon have been performed on networks of coupled lasers which have led to the demonstration of their collective phase locking [2] and coherent beam combining [3] These results have subsequently been extended to the technology of modelocked laser-based optical frequency combs

The idea lingers in the term optical density, a property of a material that the index of refraction measures ²³ Total internal reflection One important consequence of Snell's law of refraction is the phenomenon of total internal reflection If light is propagating from a more dense to a less dense medium (in the optical sense), ie $n_1 > n_2$
